PROFESSIONAL PROFILE

Backend Engineer focused on the Java 21/17 ecosystem and Spring Boot 3.x. Specialized in designing secure architectures using Spring Security (OAuth2/JWT) and optimizing cloud resources. My technical differentiator is the ability to operate complex systems in resource-constrained environments (OCI Free Tier), implementing memory efficiency strategies (JVM tuning) and multi-architecture automated deployments.

TECHNICAL SKILLS

- Languages/Frameworks: Java 21, Spring Boot 3.4.3, Spring Data JPA, Spring Security 6
- Security: OAuth2, Stateless JWT, Token Blacklisting (Redis), RBAC, Edge Validation
- Architecture: Microservices, Hexagonal Architecture (Ports & Adapters), Strategy Pattern, REST APIs
- DevOps/Cloud: Docker (Buildx), CI/CD (GitHub Actions), Oracle Cloud (OCI), ARM64/AMD64, Nginx Proxy Manager
- Databases: PostgreSQL, MySQL, Redis (Cache & Pub/Sub)

TECHNICAL EXPERIENCE & PROJECTS

SaaS Architect | [PyMes Admin](#) (Financial Management Platform)

Project under construction (MVP Q2 2026)

- Established the Core Auth Service with OAuth2 support (Google) and secure token flows in a microservices architecture
- Implemented an Edge Validation strategy in the API Gateway, allowing internal microservices to operate in an isolated network, optimizing CPU and DB consumption
- Resolved deployment incompatibility between GitHub (AMD64) and OCI (ARM64) using multi-platform Docker Buildx pipelines
- Optimized RAM consumption on free OCI instances by limiting JVM memory (-Xmx384m) and replacing heavy brokers with Redis Pub/Sub, saving over 500MB of memory

Backend Developer | [Skill Link](#) (Mentorship Platform)
Alumnithon 2025 Project

- Architected the real-time communication system using Spring WebSockets for group chats and 1:1 mentorships
- Designed the normalized PostgreSQL schema and managed automated deployment on Render
- Implemented the Strategy Pattern to decouple the notification system, allowing dynamic switching between SMS providers (Twilio/Vonage) via configuration
- Developed a Feature Flags API with role-based authorization (RBAC) to enable production features without new deployments .

Backend & Integrations | [Car Rental](#) & [Feature Flag APIs](#)

- Implemented the Strategy Pattern to decouple the notification system, allowing dynamic switching between SMS providers (Twilio/Vonage) via configuration
- Developed a Feature Flags API with role-based authorization (RBAC) to enable production features without new deployments

ENGINEERING ACHIEVEMENTS

- "RAM-Safe" Deployment: Designed a CI/CD pipeline that prevents server lockups (OOM) in environments with less than 2GB of RAM through controlled container shutdown orchestration
- Maintainability: Applied Hexagonal Architecture to the Employee Management System, achieving complete independence between business logic and infrastructure (MySQL/Flyway)
- Security: Managed secrets using GitHub Environments, eliminating the insecure use of manual .env files on the server
